

VIRTUALShield

3D asset protection system

Virtualshield™ - Three dimensional asset protection

Virtualshield™ is an innovative product for asset protection. In contrast to the common video surveillance based on 2D video or thermal cameras, Virtualshield™ makes use of **3D depth sensors**. The system, exploiting information provided by third dimension, reliably estimates distances of objects and persons in the monitored area and **dramatically reduces false alarm rates** when compared to traditional video surveillance systems. With an easy to use interface the user defines a **3D shape** around the asset (or assets) that has to be protected, delimiting the boundaries in all the three dimensions. No more alarms are triggered if a person passes in front or behind of a monitored asset without really penetrating the 3D limited shape. Push asset protection one dimension ahead with Virtualshield™!

Virtualshield™ - Three dimensional asset protection

- Three dimensional analysis engine
- Robust detection
- Very low false positives
- Indoor and outdoor operation

Virtualshield™ - Applications

- Sensible places (Power plants, antennas, etc.)
- Museums
- Archeological sites
- Monuments
- ...
